

Hunter Debrief 9/1

What the scanner hunts for, every pick it recorded on its first live premarket, and what each one did in the minutes that mattered. All prices and times come from the permanent signal records on the droplet — nothing reconstructed from memory.

WTNS 4 popped in the early window	LOSSES 7 6 of 7 pre-date the filters	UNIVERSE 1,604 NASDAQ · NYSE · AMEX common	TRUE BUYS 0 bar is score ≥ 75 — see § 4
--	---	---	--

The outcome rule (your definition): each pick is judged only on the first 30 minutes after it becomes tradable (7:00 ET broker open, or the moment it fired if later). Up ≥ 2% inside that window → **WIN, locked forever**. Down ≥ 2% without the pop → **LOSS**. Where it sits hours later never changes the verdict.

01 What it scans for

The funnel runs every ~60–90 seconds from 4:00 AM ET, on the droplet, unattended.

01	Universe — Every active common stock on NASDAQ/NYSE/AMEX in your price band (\$0–\$5): 1,604 symbols . ETFs, funds, warrants, units excluded. Rebuilt twice a day.
02	Discovery — Four doors, all open at once: top-gainers & most-actives lists · any universe stock with fresh news (quoted within ~1–5 min) · a rotating 100-symbol sweep of the whole universe (~18 min full rotation) · anything gapping ≥ 3% joins the pool.
03	Measurement — Live extended-hours tape per candidate: real premarket trade prints, bid/ask spread, minute-volume history the app accumulates itself, VWAP, premarket high/low structure, RVOL vs the stock's normal morning, and float rotation — the % of the entire float already traded.
04	Evidence — Last 7 days of SEC filings (8-K items, S-1/424B dilution forms, going-concern flags) + per-symbol news + press coverage, AI-classified for direction, materiality, novelty, confidence. Multiple catalysts per stock, each source-linked.
05	Score 0–100 — Deterministic: momentum & volume 30 · catalyst 25 · SEC filings 15 · liquidity 10 · price confirmation 10 · company quality 10 (float-first: ultra-low float and the microcap sweet spot score highest) – penalties for dilution, recycled news, overextension, no catalyst.
06	Record — WATCH fires at score ≥ 35 plus the quality filters (§ 3); BUY demands score ≥ 75, verified catalyst, RVOL ≥ 3×, your volume floors, fresh quote, tight spread, after 7:00 ET. Both are frozen at the found price forever and tracked from it.

02 Every pick, judged on its window

Found price is immutable. Two duplicate RDHL rows were invalidated by de-duplication and are excluded from the scoreboard.

RDHL**WIN +9.2%**

found 6:51 AM

found **\$0.7965** · window **\$0.7965** → **\$0.87** · float 2.3M · gap +20.5% · divestiture, conf 0.9

The textbook winner. RedHill Biopharma: fresh positive divestiture news, microscopic 2.3M float, found at a genuinely live price minutes after the stale-tape fix landed. Never ticked below the found price; popped 9% inside the window.

CVKD**WIN +9.1%**

found 6:41 AM

found **\$1.4201** · window **\$1.4201** → **\$1.55** · float 3.1M · gap -7.8% at find · FDA meeting outcome, conf 0.9

Bought weakness on a real catalyst. Cadrenal Therapeutics, FDA-meeting news, found while the stock was red on the day — not chased. Ran +9% in the window and peaked +23% later in the morning. Low float did the amplifying.

SOAR**WIN +3.2%**

found 8:32 AM

found **\$0.2199** · window **\$0.2185** → **\$0.227** · float 2.7M · rotation 57.6% · neutral filing catalyst

A lucky win, honestly labeled. Volato Group fired on a neutral SEC-filing catalyst before the quality filters existed. Heavy float rotation carried it up 3% — but today's filters would not record a catalyst-less pick.

GPRO**LOSS -6.5%**

found 5:27 AM

found **\$1.4971** · window **\$1.3991** → **\$1.4971** · float 163.8M · gap at find +145% · shareholder change

The chase. GoPro's Markiplier story was real, but the pick fired at the exact top of a +145% spike — the found price WAS the window high; it never traded a cent higher. Now blocked by the 100% gap cap.

AMBR**LOSS -16.3%**

found 6:12 AM

found **\$1.32** · window **\$1.105** → **\$1.32** · float 3.6M · rotation 242% · business transformation

Exhaustion, not ignition. Amber International had rotated its float 2.4× before the pick — the move was spent and fading through VWAP when recorded. Straight down 16%. The above-VWAP filter now rejects exactly this shape.

AUUD**LOSS -15.3%**

found 7:11 AM

found **\$1.1085** · window **\$0.939** → **\$1.1085** · float 4.8M · rotation 157% · business expansion

Same fade, same lesson. Auddia: soft story, float already rotated 1.5×, found at its window high, bled 15%. Late entry into a spent move.

NCPL

LOSS -5.8%

found 7:28 AM

found \$0.8483 · window \$0.7993 → \$0.8483 · float 4.4M · rotation 24% · neutral SEC filing

No reason to run. Netcapital gapped 23% on a routine filing classified neutral, materiality ~0. Momentum without a story rarely holds. The mandatory-catalyst filter now rejects it.

SST

LOSS -3.7%

found 7:52 AM

found \$2.43 · window \$2.34 → \$2.43 · float 2.0M · rotation 1.9% · app performance

Nobody showed up. System1 had a story and a tiny float — but only 1.9% of that float had traded. Without participation there is no fuel. Rotation now feeds the score to separate SSTs from RDHLs.

RITR

LOSS -15.7%

found 9:04 AM

found \$0.1093 · window \$0.0921 → \$0.1093 · float 20.4M · rotation 28% · debt elimination

Sub-11¢ shell behavior. The classic distressed-microcap PR. At this price tier, spreads and manipulation risk dominate any signal. Worth a dedicated price floor if these keep appearing.

AMBR #2

LOSS -2.1%

found 10:15 AM

found \$1.195 · window \$1.17 → \$1.195 · post-filter pick · rotation 242% (premarket)

The one legitimate post-filter loss. Passed every new rule (positive catalyst, 3% gap, above VWAP) and still slipped 2.1% — a normal, shallow loss. This is what acceptable losses should look like: small, not -15%.

Invalidated duplicates: RDHL re-fired at \$0.8963 (7:08) and \$0.8748 (7:22) when new headlines changed the catalyst fingerprint. De-duplication (one pick per symbol per day) is now enforced; both rows are excluded from the scoreboard and dimmed in the app.

03 The pattern, and what now blocks it

Chasing extension	GPRO fired at the top of +145%. Now blocked: no pick above a 100% gap.
Fading through VWAP	AMBR and AUUD were spent moves already below premarket VWAP. Now blocked: price must hold above VWAP.
No real catalyst	NCPL and SOAR fired on neutral filings. Now blocked: a fresh, positive, sourced catalyst is mandatory.
No participation	SST moved on 1.9% float rotation — no fuel. Now scored: rotation feeds momentum points directly.
What wins share	RDHL and CVKD: fresh positive catalyst (conf 0.9) + float under 3.5M + entry early or on a dip, never at the spike top. Every winner passes today's filters; every deep loser fails at least one.

04 Why no true BUY yet – found & fixed

Scores topped out around 46 all morning against the 75-point BUY bar. Pulling the stored score snapshots for this report exposed the reason: **the AI was grading materiality 2–3 on its own small scale while the engine expects 0–100** — so the 25-point catalyst component was contributing under 1 point even for a 0.9-confidence FDA catalyst. The analysis prompt now anchors the scale explicitly (50–70 = clearly market-moving for a microcap), and every cached analysis re-grades under the new contract. Real catalysts should now push genuine setups into the 60s–70s, within reach of the BUY gate.

Everything shipped during the session

4:00 AM	First live premarket. Full pipeline scanning from the droplet.
5:14 AM	Live tape fix. Found the entitled aftermarket-trade endpoint; prices switched from lagging quotes to real premarket prints (your RDHL \$0.79 report).
5:5x AM	Watch tier + carry-in volume. Notable picks recorded permanently; premarket volume counter no longer under-counted.
7:30 AM	Tracking correction. Stale prints had leaked into current/high/low fields; extremes reset with an audit event on each record.
7:50 AM	Loss filters. Gap cap · mandatory positive catalyst · above-VWAP.
10:0x AM	Your outcome rule. First-30-minutes window, verdicts locked forever; duplicates invalidated.
10:4x AM	Materiality calibration. The catalyst-scoring bug above.

Honest caveats. Nine decided picks is a tiny sample — the filters are logically sound but unproven forward. Six of the seven losses pre-date the filters, so the 36% headline understates the go-forward system. RVOL is still the labeled estimate until per-symbol premarket history accumulates (~5 sessions). Research signals only; nothing here is investment advice.
